

Facility Dashboard

Côte d'Ivoire (CI) remains one of the highest HIV-prevalence countries in West Africa at an estimated 3.7% of the adult population. With funding from ----- (Donor) -----, ----- (Donor) -----, ----- (NGO XYZ) ----- has been partnering with the CI Ministry of Health since (year) to strengthen HIV/AIDS prevention, care, and treatment service delivery. The program serves (x) health facilities in (x) regions (x) districts) in ----- (location) ----- . Since only 37.2% of people living with HIV in CI report knowing their status, one of the strategic foci of the program is to help facilities provide more HIV tests and increase the yield of testing (percentage of test results that are positive). Since index testing is a strategy that has been shown to yield more positives than conventional facility-based testing services, we also focus on index testing.

This **Facility Dashboard** is designed to help program staff, regional and district health directors, and facility managers monitor the performance of HIV testing service delivery at each of the (x) health facilities supported by (NGO) over the five quarters from October 2017 to December 2018. The **Summary** tab shows the number of all types of HIV tests performed, the number of index tests performed, the number of positives, and the yield. You can switch between the number of positives and yield as the value that you would like to compare to the number of tests provided. The **Compare** tab shows how the chosen facility compares with the other (x) facilities supported by the program in terms of the number of positive results and yield.
